EIDR System

Version 2.0.7
Release Notes
Jul. 7, 2015

The Release Notes list:

- What is New in this Release
- Issues Addressed in this Release
- Limitations
- Open Issues.

What is New in this Release
This release includes the schema-compatible changes and new features in the Registry data model. The following is a high-level summary:

- Support for the API request header Accept-Encoding for compressing the response data. Only gzip format is supported. See the EIDR Rest API Reference for details.
- A new API for getting full or partial snapshots of the EIDR database.

Issues Addressed in this Release
The following issues and enhancements have been resolved in this release:

- Comparison of full dates and years for the Release Year in Episode de-duplication has been corrected. (#1288)

Limitations

- It is possible to create duplicate records if create or modify record operations are performed close together. (#493)
- It is possible to create a duplicate content record if a work is registered with a title (for example a working title, a title change, Romanized title, subtitle, or title in another language) that is not listed as the title or alternate title of an existing record for the same work. It is important to include all frequently occurring titles of a work when creating a record, most especially the original released title in the original language. (#659)
- De-duplication does not consider episodes outside of the immediate season, so it is possible to create a duplicate episode within different seasons. (#919)

Open Issues

- Asset resolution type Inherited does not work. (#466)
- Compilation deduplication is not catching near duplicates. (#1112)
