EIDR System

Version 2.0.9
Release Notes
Dec. 16, 2015

The Release Notes list:

- What is New in this Release
- Issues Addressed in this Release
- Limitations
- Open Issues.

What is New in this Release
This release includes new features in the Registry. The following is a high-level summary:

- Improve the Registry security model so that all API transactions other than Resolution require user credentials for an associated Party that has at least Reader permissions in the EIDR content Registry.

Issues Addressed in this Release
The following issues and enhancements have been resolved in this release:

- Allow a distribution number of zero for episodes with an EpisodeClass of Special (#1239).
- Separate Credits inheritance for Directors and Actors. (#1254)
- Exclude Composite elements as duplicate candidates for Composite records (#1291)
- Improvements to Unicode whitespace handling to include non-breaking space (U+00A0) and ideographic (fullwidth) space (U+3000) for tokenization. Other Unicode spacing characters have also been included that are rare and not currently found or expected in film titles (such as six-per-em space). (#1317)

Limitations

- It is possible to create duplicate records if create or modify record operations are performed close together. (#493)
- It is possible to create a duplicate content record if a work is registered with a title (for example a working title, a title change, Romanized title, subtitle, or title in another language) that is not listed as the title or alternate title of an existing record for the same work. It is important to include all frequently occurring titles of a work when creating a record, most especially the original released title in the original language. (#659)

Open Issues

- Asset resolution type Inherited does not work. (#466)
• Compilation deduplication is not catching near duplicates. (#1112)
• The ASCII question mark character and Non-Latin1 Unicode punctuation in text fields are not being recognized for tokenization. (#1342 & #1343)
